ABSTRACT

Understanding of economic issues in general today, knowledge requires effort, much larger than analysis as occurs at the beginning of the century XXI. First major economic and financial crisis of this century is not only a crisis component that finds humanity as a whole, but with varying degrees of manifestation of one country to another, from one area to another.

Currently witnessing, in a real system crisis, the manifestations and causes generating different origins.

The main cause is but one man company in an effort to develop, to learn, to live better, to think only in the spirit of producing more of cosume longer get as high profit, destroying the environment everything around us.

Understanding of economic issues in general today, knowledge requires effort, much larger than analysis as occurs at the beginning of the century XXI. First major economic and financial crisis of this century is not only a crisis component that finds humanity as a whole, but with varying degrees of manifestation of one country to another, from one area to another.

Currently witnessing, in a real system crisis, the manifestations and causes generating different origins.

The main cause is but one man company in an effort to develop, to learn, to live better, to think only in the spirit of producing more of cosume longer get as high profit, destroying the environment everything around us.

Now that we live up to the global dimension in a complex and profound crisis consider to be a challenge for the purposes of its awareness of the entire population of the world, in order to modify the degree of perception, action, behavior, including system values, mainly cultural and educational.

"At the beginning of the last decades of the twentieth century, we are in a state of deep crisis global. Crisis is a complex, multidimensional facets whose touch every aspect of our lives and livelihood, health, environmental quality and social relations, economy, technology and intellectual dimensions politica. Este crisis, moral and spiritual crisis of unforeseen precedent in human history. For the first time to confront the very real threat of extinction of the human race and all life on Earth." [1]

And I dare to remember the need for and the other problems that the current economic crisis thinking, as a new stage of this process in time and space.

Today, you should not ignore the fact that we live in a time of uncertainty, risk, vulnerability, turmoil, fear itself. "Today's world puts us in front of so many possibilities that we can not predict what we will do and even less to will our children.

They are bred by people who know people, not because parents would be fooled, but because the world has become too old to be fully known. Parents must eventually learn to teach children how to cope in conditions of uncertainty, not how to ensure stability." [2]

Regarding economic growth amid the current crisis is necessary to reformulate it as a combination of requirements and criteria optimum economic, social, environmental, including educational and cultural values (both the old and new) . All conditions necessary for growth / development is striking, however, limits, challenges, limited natural environment over which we can reach passing serious shortcomings in disaster, even at the risk of survival of humanity.

Great Depression of the XXI century, along with other crises known, can provide a framework for great change to come, for new models and future growth strategies. Searches for new models and strategies for economic and social development can be made and made than through a split from the model until today, entering several decades in a real crisis. "Today is a new formulation of premises created theories that economic theory rupture Sea Economic Change." [3]

Global financial and economic crisis occurred in 2008 is already labeled as the first Great Depression of the XXI century, which will bring significant changes to capitalism, a deterioration in economic doctrine and

practice of liberal, while a return to dirijismului, type Keynesian interventionism, changes in international power relations. All these mutations will fit in great change to come.

New Economy concept formulated by DCKorten involves "creating a new economy growing and rewards what is best, not what is worst in our nature and therefore we have to fulfill an old dream of man." [4]

Growth / economic development in the future but adapted to new realities, located on other grounds, along with other factors such as balance of power, international law, decisions and influence the great powers (old or new) with other institutions, regional and global will maintain an international order (peaceful as possible) will ensure that mutations, changes, adjustments necessary and possible.

The future must be explored and developed only in a systemic view, the inter-activity of everything mean human life, including the fundamental relationship of human-kind company.

A healthy growth in the context of the new economy requires several priorities imediate. Of them mention: reallocation of resources allocated incorrectly, the Convention of the military, ecological construction and restricting urban expansion, advertising and public media resources, reallocation of resources to uses harmful or wasteful, restoration of forest land, agricultural and wildlife, strengthening communities, improving energy efficiency, etc ...

Short-term solutions to a problem or just another paleative. Crises we face us have seen the medium and long term.

Modernity but we always offer the best examples.

Thus old and new crises to be compared with the past, but also trends, challenges ahead.

To opt for life and not let them run aotic randomly. Hopefully in another possible world different than the one today, but like many values of the relatively distant past.
